1 Planning student laboratories—what isn't new? 77

Lisa Covi

Proceedings of the 16th annual ACM SIGUCCS Conference on User Services October 1988

Planning a computer lab is a complex project on any campus. Most planners start from scratch because either they aren't aware that others have done it already, they believe that their situation is unique or they just don't have time to investigate efforts elsewhere. Even when planning a second lab, technical, political and environmental constraints change so much that the methods used for the first lab do not apply to the second. Columbia University Center for Computing Activitie ...

2 An overview of logic synthesis systems 77

L. Trevillyan

Proceedings of the 24th ACM/IEEE conference on Design automation October 1987

The term logic synthesis is used to describe systems that range from relatively simple mapping schemes to tools with sophisticated logic optimizations. In this tutorial, the requirements on logic synthesis systems will be discussed and the advantages and disadvantages of different approaches to logic synthesis will be presented.

1 Technical correspondence: Representing change by aspect 80

Peter Dolog , Valentino Vranić , Mária Bieliková
ACM SIGPLAN Notices December 2001
Volume 36 Issue 12

We propose the application of aspectoriented programming to software configuration management. We believe it could improve the change control by providing a new basis for reasoning about a change. To demonstrate this, we designed an abstract-oriented extension to procedural languages where a change is represented by an aspect. Consequently, a change gains the properties of an aspect: it becomes well-localized and separated from the (unchanged) base program. This goes beyond the current capabilit ...

2 E-commerce: SweetDeal: representing agent contracts with exceptions using XML rules, ontologies, and process descriptions 77

Benjamin N. Grosof , Terrence C. Poon
Proceedings of the twelfth international conference on World Wide Web May 2003

SweetDeal is a rule-based approach to representation of business contracts that enables software agents to create, evaluate, negotiate, and execute contracts with substantial automation and modularity. It builds upon the situated courteous logic programs knowledge representation in RuleML, the emerging standard for Semantic Web XML rules. Here, we newly extend the SweetDeal approach by also incorporating process knowledge descriptions whose ontologies are represented in DAML+OIL (emerging standa ...

3 Mirage: a coherent distributed shared memory design 77

B. Fleisch , G. Popek
ACM SIGOPS Operating Systems Review , Proceedings of the twelfth ACM symposium on Operating systems principles November 1989
Volume 23 Issue 5

Shared memory is an effective and efficient paradigm for interprocess communication. We are concerned with software that makes use of shared memory in a single site system and its extension to a multimachine environment. Here we describe the design of a distributed shared memory (DSM) system called Mirage developed at UCLA. Mirage provides a form of network transparency to make network boundaries invisible for shared memory and is upward compatible with an existing interfac ...

4 An object oriented approach to CAD tool control within a design framework 77

J. Daniell , S. W. Director
Proceedings of the 26th ACM/IEEE conference on Design automation June 1989
As VLSI design frameworks evolve, a distributed control mechanism for CAD tools has become a central research issue. In this paper, we present an object oriented tool integration methodology that treats the tools as objects. This approach simplifies CAD tool control within a design framework making the framework more general, easier to use, and more capable of supporting a large population of CAD tools.

5 The Howitzer improvement program: lessons learned 77
D. Krantz

6 A structural view of the Cedar programming environment 77
Daniel C. Swinehart , Polle T. Zellweger , Richard J. Beach , Robert B. Hagmann
ACM Transactions on Programming Languages and Systems (TOPLAS) August 1986
Volume 8 Issue 4
This paper presents an overview of the Cedar programming environment, focusing on its overall structure—that is, the major components of Cedar and the way they are organized. Cedar supports the development of programs written in a single programming language, also called Cedar. Its primary purpose is to increase the productivity of programmers whose activities include experimental programming and the development of prototype software systems for a high-performance personal computer. T ...

7 Replacing version-control with job-control 77
G. M. Clemm
ACM SIGSOFT Software Engineering Notes , Proceedings of the 2nd International Workshop on Software configuration management October 1989
Volume 14 Issue 7
Version-control is a mechanism for managing the multiple versions of the software objects that are created during the software development process. Traditionally, version-control consists of providing tools for generating a branching tree of versions, with facilities for reserving a given version for modification. In the Workshop System the focus of version-control is shifted from the objects produced during the software process to the software process itself. Objects called jobs

8 Microarchitecture modelling through ADL 77
E. S.T. Fernandes
Proceedings of the 21st annual workshop on Microprogramming and microarchitecture January 1988
ADL is an Architecture Description Language that has been developed to model computer architectures at different levels of detail, as for instance, at the microarchitecture level. Target architectures described in ADL are processed by the support system of the language which generates an interpreter program related to the description of the target machine. The interpreter reproduces the behavior of the architecture being modeled, including the interpretation of the target code.

9 Live documents with contextual, data-driven information components 77
Anke Weber , Holger M. Kienle , Hausi A. Müller
Proceedings of the 20th annual international conference on Computer documentation October 2002
We introduce the notion of a live document and we describe our concept of live documents with contextual, data driven information components. The dynamic and interactive features of live documents provide a consistent data source for multimedia presentations targeted to various audiences and multiple platforms. Therefore, they contribute to the solution of key challenges in single sourcing and repurposing. We motivate the use of live documents with sample scenarios from the field of systems docu ...

10 Caching: A multicast-based distributed file system for the internet 77

Björn Grönvall , Ian Marsh , Stephen Pink

Proceedings of the 7th workshop on ACM SIGOPS European workshop: Systems support for worldwide applications September 1996

JetFile is a file system designed with multicast as its distribution mechanism. The goal is to support a large number of clients in an environment such as the Internet where hosts are attached to both high and low speed networks, sometimes over long distances. JetFile is designed for reduced reliance on servers by allowing client-to-client updates using scalable reliable multicast. Clients on high speed networks prefetch large numbers of files. On low speed networks such as wireless, special cac ...

11 Chimera: hypermedia for heterogeneous software development enviroments 77

Kenneth M. Anderson , Richard N. Taylor , E. James Whitehead

ACM Transactions on Information Systems (TOIS) July 2000

Volume 18 Issue 3

Emerging software development environments are characterized by heterogeneity: they are composed of diverse object stores, user interfaces, and tools. This paper presents an approach for providing hypermedia services in this heterogeneous setting. Central notions of the approach include the following: anchors are established with respect to interactive views of objects, rather than the objects themselves; composable, n-ary links can be established between a ...

13 Version models for software configuration management 77

Reidar Conradi , Bernhard Westfechtel

ACM Computing Surveys (CSUR) June 1998

Volume 30 Issue 2

After more than 20 years of research and practice in software configuration management (SCM), constructing consistent configurations of versioned software products still remains a challenge. This article focuses on the version models underlying both commercial systems and research prototypes. It provides an overview and classification of different versioning paradigms and defines and relates fundamental concepts such as revisions, variants, configurations, and changes. In particular, we foc ...

14 Chimera: hypertext for heterogeneous software environments 77

Kenneth M. Anderson , Richard N. Taylor , E. James Whitehead

Proceedings of the 1994 ACM European conference on Hypermedia technology September 1994

Emerging software development environments are characterized by heterogeneity: they are composed of diverse object stores, user interfaces, and tools. This paper presents an approach for providing hypertext services in this heterogeneous setting. Central notions of the approach include the following. Anchors are established with respect to interactive views of objects, rather than the objects themselves. Composable, n-ary links can be established between an ...

ACM SIGMOD Record , Proceedings of the 1985 ACM SIGMOD international conference on Management of data May 1985
Volume 14 Issue 4

2 The Felix File Server 77
M. Fridrich , W. Older
Proceedings of the eighth ACM symposium on Operating systems principles December 1981
This paper describes Felix - a File Server for an experimental distributed multicomputer system. Felix is designed to support a variety of file systems, virtual memory, and database applications with access being provided by a local area network. Its interface combines block oriented data access with a high degree of crash resistance and a comprehensive set of primitives for controlling data sharing and consistency. An extended set of access modes allows increased concurrency over conventio ...

3 Chip assemblers: Concepts and capabilities 77
Randy H. Katz , Shlomo Weiss
Proceedings of the 20th conference on Design automation June 1983
A chip assembler is a tool for managing design information. It encourages a structured design methodology, wherein a design is described by a collection of hierarchical design decompositions, one for each of its representations. It assists in the enforcement of consistency constraints up, down, and across the different hierarchies. We argue that a chip assembler, as an integrated design environment, requires an integrated approach for the management of design data. We describe what a chip a ...

4 A structural view of the Cedar programming environment 77

5 The Alpine file system 77

M. R. Brown , K. N. Kolling , E. A. Taft

ACM Transactions on Computer Systems (TOCS) November 1985

Volume 3 Issue 4

Alpine is a file system that supports atomic transactions and is designed to operate as a service on a computer network. Alpine's primary purpose is to store files that represent databases. An important secondary goal is to store ordinary files representing documents, program modules, and the like. Unlike other file servers described in the literature, Alpine uses a log-based technique to implement atomic file update. Another unusual aspect of Alpine is that it performs all commu ...

6 Invited papers: Impact of the research community on the field of software configuration management: summary of an impact project report 77

Jacky Estublier , David Leblang , Geoff Clemm , Reidar Conradi , Walter Tichy , André van der Hoek , Darcy Wiborg-Weber

ACM SIGSOFT Software Engineering Notes September 2002

Volume 27 Issue 5

Software Configuration Management (SCM) is an important discipline in professional software development and maintenance. The importance of SCM has increased as programs have become larger and more complex and mission/life-critical. This paper discusses the evolution of SCM technology from the early days of software development to present and the impact university and industrial research has had along the way. It also includes a survey of the industrial state-of-the-practice and research directio ...

Proceedings of the 1996 ACM symposium on Applied Computing February 1996

10 Document Examiner: delivery interface for hypertext documents 77

Janet H. Walker

Proceeding of the ACM conference on Hypertext November 1987

This paper describes the user interface strategy of Document Examiner, a delivery interface for commercial hypertext documents. Unlike many hypertext interfaces, Document Examiner does not adopt the directed graph as its fundamental user-visible navigation model. Instead it offers context evaluation and content-based searching capabilities that are based on consideration of the strategies that people use in interacting with paper documents.

11 Version models for software configuration management 77

Reidar Conradi , Bernhard Westfechtel

ACM Computing Surveys (CSUR) June 1998

Volume 30 Issue 2

After more than 20 years of research and practice in software configuration management (SCM),

constructing consistent configurations of versioned software products still remains a challenge. This article focuses on the version models underlying both commercial systems and research prototypes. It provides an overview and classification of different versioning paradigms and defines and relates fundamental concepts such as revisions, variants, configurations, and changes. 12 The Zebra striped network file system 77

John H. Hartman , John K. Ousterhout

ACM Transactions on Computer Systems (TOCS) August 1995

Volume 13 Issue 3

Zebra is a network file system that increases throughput by striping the file data across multiple servers. Rather than striping each file separately, Zebra forms all the new data from each client into a single stream, which it then stripes using an approach similar to a log-structured file system. This provides high performance for writes of small files as well as for reads and writes of large files. Zebra also writes parity information in each stripe in the style of RAID disk arrays; this ...

13 Coupling the user interfaces of a multiuser program 77

Prasun Dewan , Rajiv Choudhary

ACM Transactions on Computer-Human Interaction (TOCHI) March 1995

Volume 2 Issue 1

We have developed a new model for coupling the user interfaces of a multiuser program. It is based on an interaction model and a user interface framework that allow users and programmers, respectively, to view applications as editors of data. It consists of a semantics model, a specification model, and an implementation model for coupling. The semantics model determines (1) which properties of interaction entities created for a user are shared with corresponding interaction entities created ...

14 The Zebra striped network file system 77

John H. Hartman , John K. Ousterhout

ACM SIGOPS Operating Systems Review , Proceedings of the fourteenth ACM symposium on Operating systems principles December 1993

Volume 27 Issue 5

Zebra is a network file system that increases throughput by striping file data across multiple servers. Rather than striping each file separately, Zebra forms all the new data from each client into a single stream, which it then stripes using an approach similar to a log-structured file system. This provides high performance for writes of small files as well as for reads and writes of large files. Zebra also writes parity information in each stripe in the style of RAID disk arrays; this increase ...

16 Reuse_system software repository tool concepts 77

Greg Gicca

ACM SIGAda Ada Letters January 1991

Volume XI Issue 1

This paper discusses a software tool called the Reuse_System. The tool was developed using the Ada language to promote software reuse. It automates concepts designed to aid in both the storage and retrieval of existing software. Its own design emphasizes end user activities in finding and then extracting software for reuse.
